

# Patient-centric Messaging

## Send Care-related and Condition-specific Emails and Texts in Your Patients' Primary or Preferred Language

### Situation

About 25.1 million individuals in the US are considered Limited English Proficient (LEP). Limited English proficiency refers to anyone above the age of 5 who reported speaking English less than "very well," as classified by the U.S. Census Bureau. English-only healthcare communications can be limited in their impact with your patients who prefer a language other than English for their day-to-day communications.

### Solution

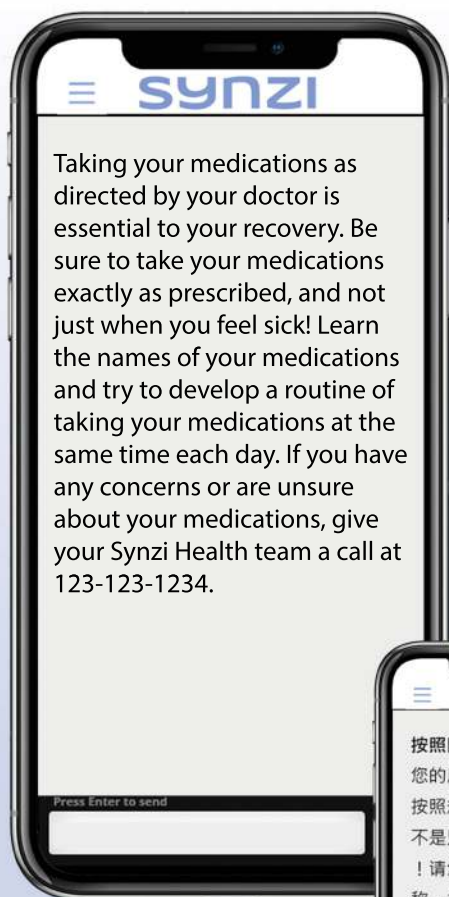

With Synzi, your agency can send translated messages to your patients with ongoing medication, dietary, exercise, and general health guidance. Synzi uses human translators to provide your agency with messaging in the languages commonly spoken by your patients. Using email and text to engage your patients and their family caregivers will drive better patient engagement during your episode of care; communicating the message in the language of your patients' choice is critical to understanding.

### Languages Available:

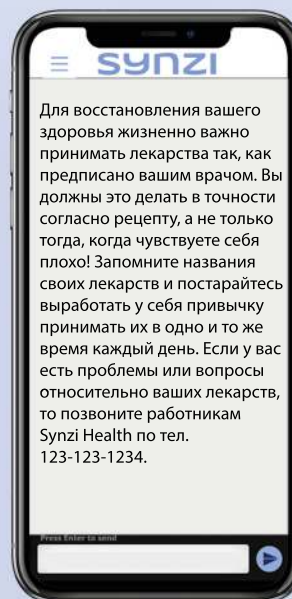

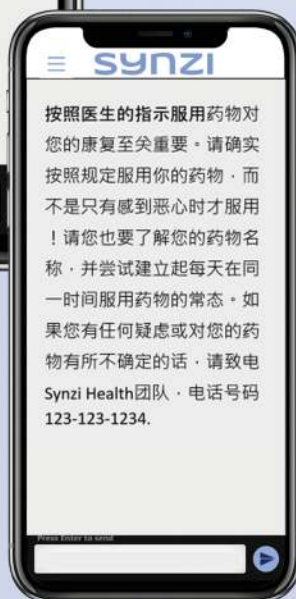

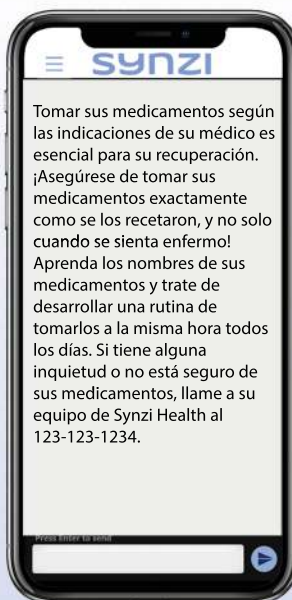

Arabic  
Armenian  
Bengali  
Bosnian  
Burmese  
Cantonese
